# IFD mCONNECT THE DYNAMIC ERP- CONNECTOR

**iFD mConnect is the interface middle layer for all of iFD Mobility applications for use outside the central organization, whether iFD mTrade for mobile sales or any other iFD mBusiness App, connecting these to different ERP or CRM-systems indirectly.**

**As the middle layer, iFD mConnect receives the requests from central and mobile sites and devices, interfacing between both systems and therefore sequestering the mobile device directly from the databases, which has a variety of advantages in terms of transparency and security, as well as to simplify the interface to other ERP- and CRM-systems and environments.**

## SCALABILITY AND SECURITY

Because based on modern XML-based web services, iFD mConnect can offer support in reaching a well-designed and scaled solution. By using multiple parallel operating web servers, receiving the requests, even in peak times, your performance will be accurate and reliable, which is essential when operating with a large number of mobile devices.

Direct access to the productive IT systems in an organization should be controlled and monitored at all times, as these direct access methods can also influence the overall data safety and security. In this context, iFD mConnect is an additional barrier between the outside and the inside covering and bundling the requests into more controllable web services.

## SUPPORTED ERP-SYSTEMS AND VERSIONS
